

## SPECIAL DEAL ON PV MODULES

Skyheat Associates, in connection with the Maine Solar Energy Association (MESEA), bought two pallets of first quality PV modules with ISO 9001 and UL certification. These modules are designed for nominal 24 volt or higher PV systems but could be used with a 12 volt off grid system if you used a maximum-power-point (MPP) equipped charge controller. These modules are offered on a first-come-first-sold basis but have 25 year warranties from their Chinese manufacturers. This batch is available for \$1 per watt since I bought them directly from one of the biggest importers of PV parts in the US. I have known these people for decades and have done them favors over the years, so I got a good deal for the people of Maine (although people in other New England states can take advantage of this communal bulk purchase if you wish).

The following photovoltaic modules are for sale at \$1 per watt:

1. 245 watt Canadian Solar modules, 30.1 Vm at 8.1Am. We have 14 left that are not spoken for at \$245 here in Downeast Maine.
2. Renasola 235W PV modules – Std. frames 30.2 Vm at 7,8 Am. We have a full pallet of 22 in Virginio's backyard in Chelmsford MA for \$235 ea.

They all measure 64 ½" x 38 3/4" in outside dimension. They all have the German style connectors that have no wires to be touched when you connect them together in high voltage strings. The junction boxes are sealed inside with silicone resin for safety purposes in high voltage systems, cutting away the sealant to modify the module output would most likely void the warranty and Certifications.

Skyheat will be happy to sell them to anybody, not just MESEA members, to get the money back for our other nonprofit uses.
